

ONE RIVER

Three-dimensional Valley Living Room

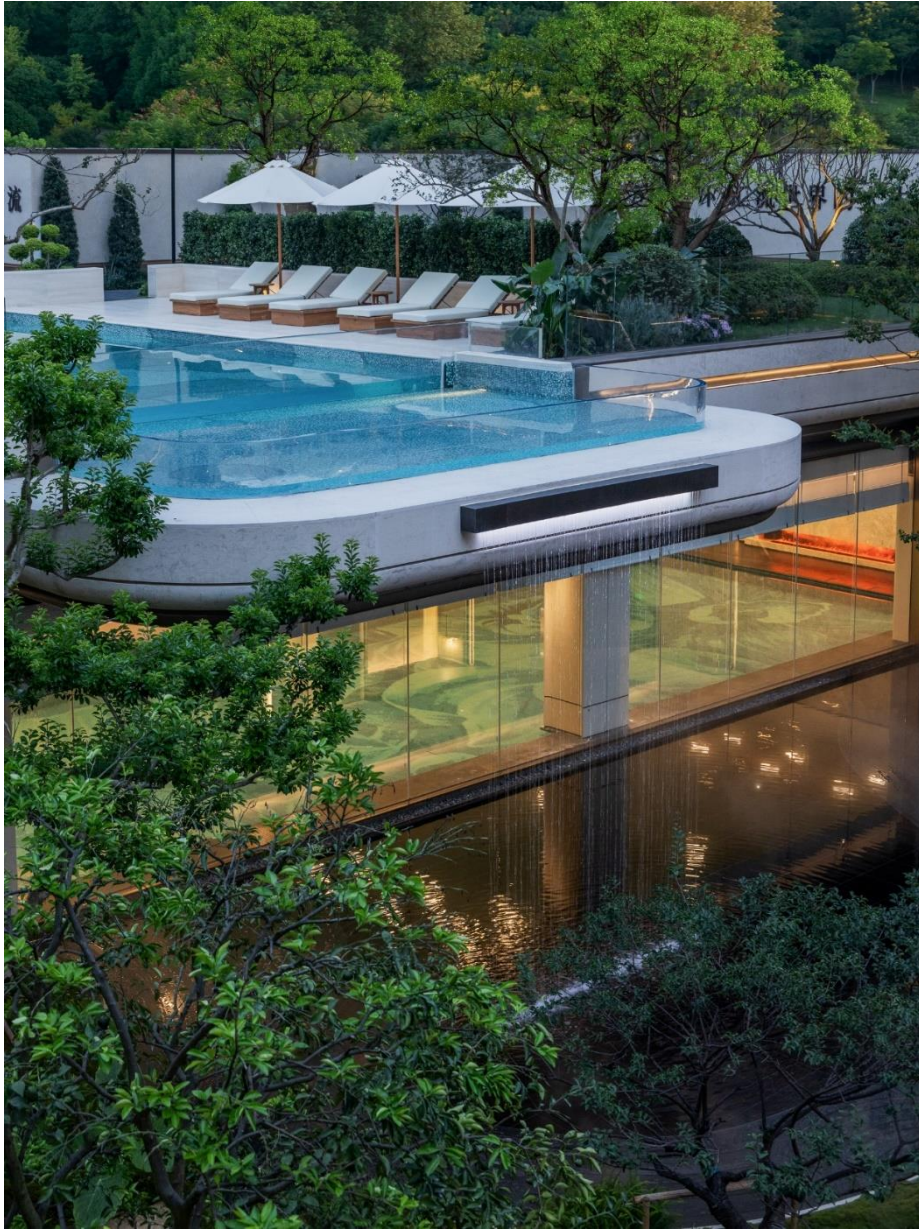

The project is located in Nanjing, China. Drawing on the compositional structure and artistic conception of ancient Chinese paintings, it reorganizes the spatial logic of the landscape. Leveraging the existing topographic elevation difference, it interprets the mountain-and-water imagery of Valleys Rushing with Streams through fluid, staggered and suspended spatial forms, creating an immersive mountain-valley residence.

The Painting of Ten Thousand Valleys
Vying for Streams(Ancient Chinese Painting)

Landscape Interpretation of Ancient Chinese Paintings

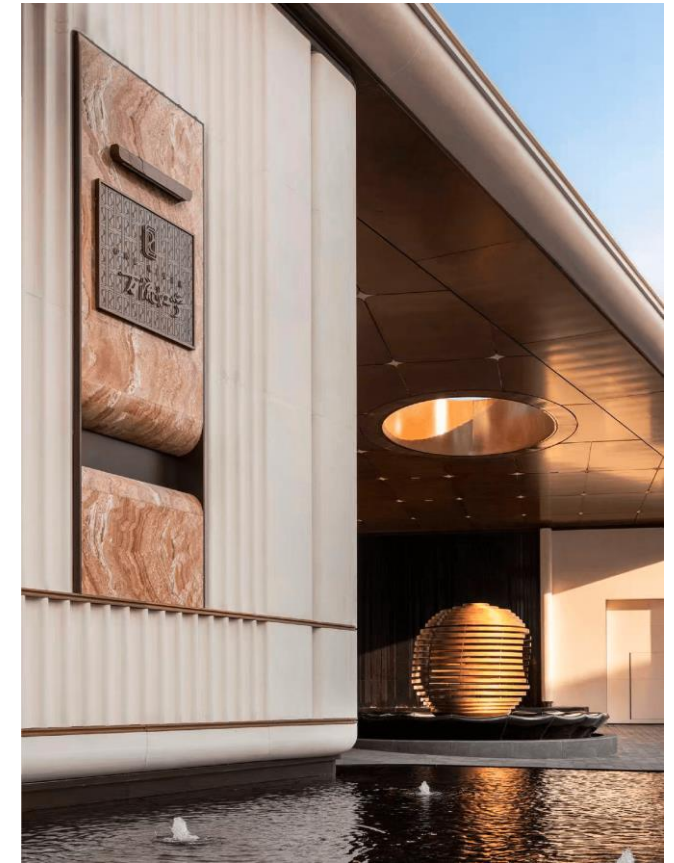

It extracts the hierarchical sequence of receding mountain layers and the alternating open-closed compositional structure from the painting to organize the spatial framework of the landscape. Fluid, staggered and suspended spatial forms echo the dynamic artistic conception of *Myriad Valleys Vying for Streams*.

Innovative Design of Vertical Space

Building upon existing topographic elevation differences, the design expresses spatial tension through suspended structures and integrates spatial boundaries with fluid lines, crafting an immersive natural-valley dwelling within nature.

Through structural penetration, it fosters interpenetration between living spaces and nature.

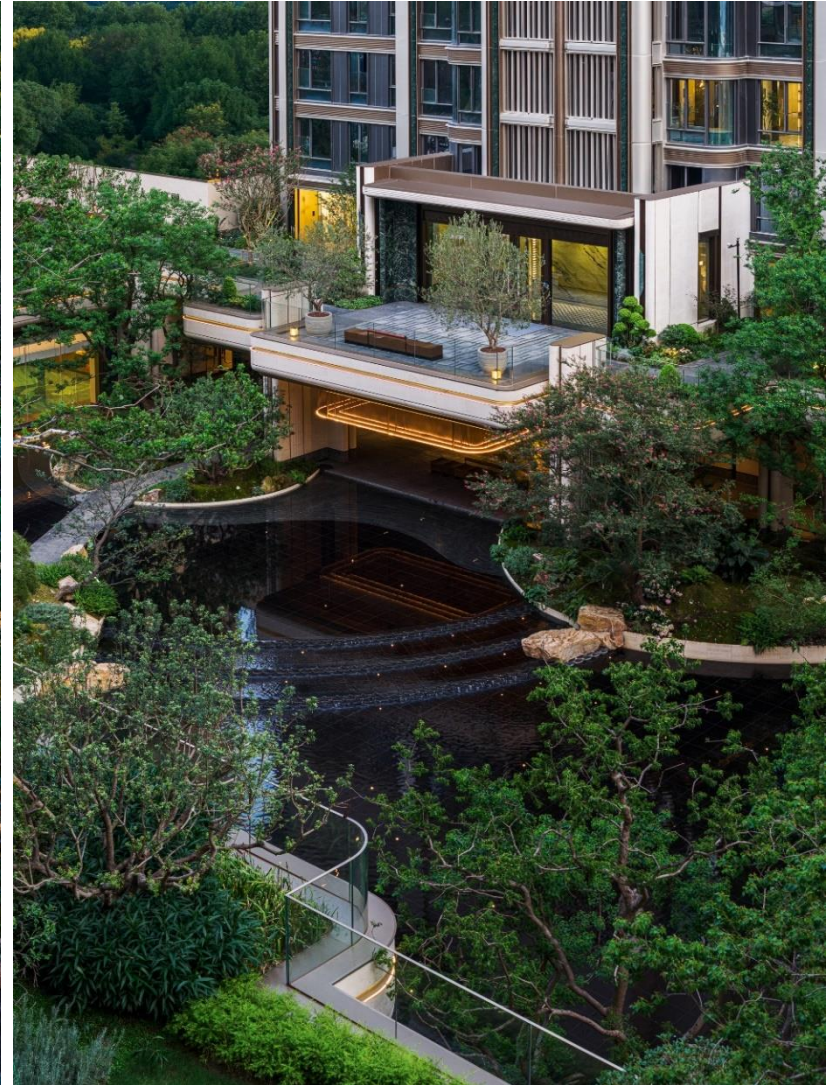

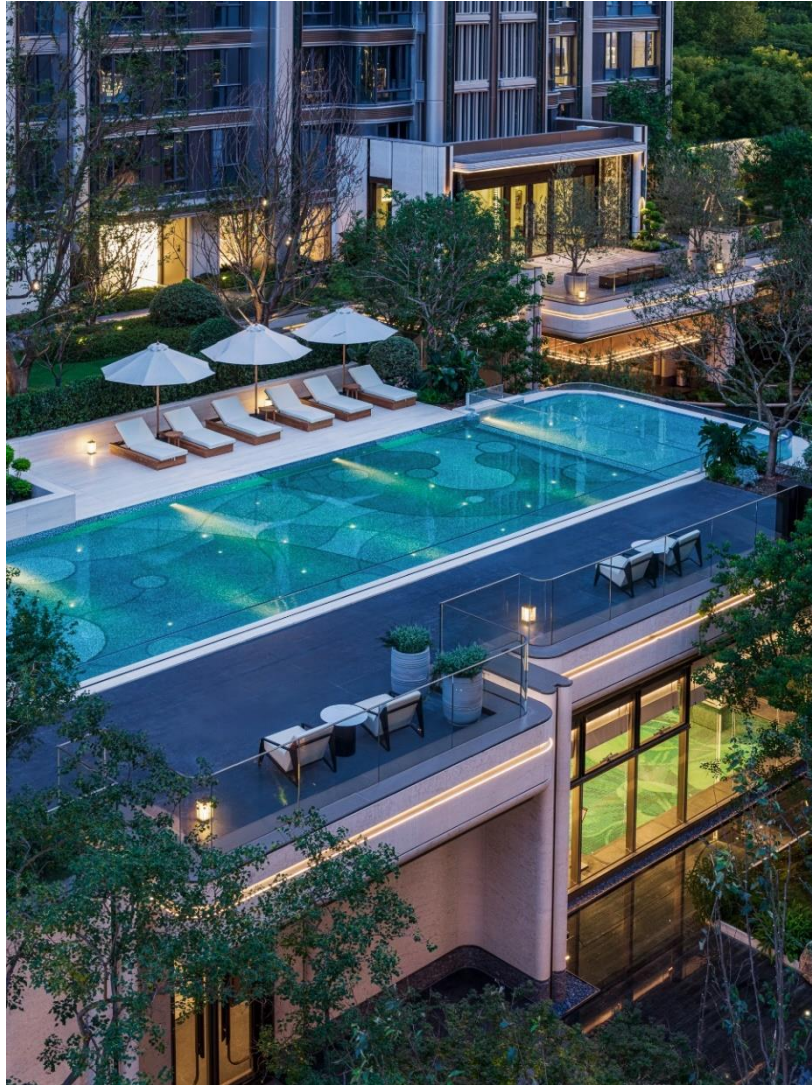

Landscape Interpretation of Intangible Cultural Heritage

The design subtly integrates intangible cultural heritage including Yunjin brocade, gold foil craftsmanship and Qinhuai lantern art into scene details. These elements collide and interweave with modern techniques, revealing profound humanistic depth in subtle details.

Deep Integration of Architecture and Landscape

The landscape integrates with multi-layered, three-dimensional architectural structures to embed multi-functional spaces including swimming pools, recreation zones and viewing platforms. Instead of functioning as a standalone container, the building serves as a carrier for landscape growth.

Deep Integration of Architecture and Landscape

Through progressive visual and spatial relationships, the design enables nature to penetrate inward dynamically and constructs a spatial narrative of natural flow.

integration and penetration of spatial boundaries
